Most of the work on XML query and search has stemmed from the publishing and database communities, mostly for the needs of business applications. Recently, the Information Retrieval community began investigating the XML search issue to answer information discovery needs. Following this trend, we present here an approach where information needs can be expressed in an approximate manner as pieces of XML documents or "XML fragments" of the same nature as the documents that are being searched. We pr ...

Finding a suitable fragment of interest in a nonschematic XML document with a simple keyword search is a complex task. To deal with this problem, this paper proposes a theoretical framework with a focus on an algebraic query model having a novel query semantics. Based on this semantics, XML fragments that look meaningful to a keyword-based query are effectively retrieved by the operations defined in the model. In contrast to earlier work, our model supports filters for restricting the size of a ...
